

[PROJECT #2]

Validating Form

`FILTER_VALIDATE_EMAIL`

filter_var()

This function is used for various types of data filtering and validation. It is part of the filter extension, which provides a set of filters for validating and sanitizing data.

Syntax : `filter_var(variable, filtername, flag)`

filter_var()

Here are some commonly used filters:

- *FILTER_VALIDATE_EMAIL: Validates an email address.*
- *FILTER_VALIDATE_URL: Validates a URL.*
- *FILTER_VALIDATE_INT: Validates an integer.*

FILTER_SANITIZE_EMAIL

To sanitize we can use FILTER_SANITIZE_EMAIL , predefined filter constant or a string representing a filter name.
