Functions
in PHP

```
echo "Welcome to Website";
echo "<br>";
echo "Visit products page";

//....Some code
//....Some code

echo "Welcome to Website";
echo "<br>";
echo "Visit products page";

//....Some code
//....Some code

echo "Welcome to Website";
echo "<br>";
echo "Visit products page";
```

```
greet(){
    echo "Welcome to Website";
    echo "<br>";
    echo "Visit products page";
}
```

FUNCTIONS

```
greet();

greet();

greet();

greet();
```

What are Functions ?

Well ,in the most simple form a function is simply a piece of code that we can reuse over and over again in our code.

In PHP, functions are blocks of reusable code that perform a specific task. They allow you to break down your code into smaller, manageable parts, making it easier to understand, maintain, and reuse. Functions in PHP can take input parameters, process them, and return a result.

Syntax:

```
function functionName(){          Function Declaration/Function Definition

// Code Statement                              Function body

}

functionName();                    Calling a function/Invoking a function
```
